## Summary

The research was divided into 4 teams including IoT, Computer Vision, Sound detection and Paper. The IoT team set the development environment to test the proposed work. The Computer Vision team researched about the OpenCV in shooting situations, including archery. The Sound detection team collected the gun sound dataset. The Paper team reviewed the abstract section of the paper.

## What SharpShooter completed this week:

- Installed LoRa and Pycharm in Raspberry Pi 4B  
Python code and LoRa communication should be performed on Raspberry Pi. However, the development takes place on the local computer. So, the code must be transferred to Raspberry Pi. Therefore, the local computer development environment and Raspberry Pi were linked.
- Researched about OpenCV and Gunshot sound classification  
In order to detect the difference of the images in archery similar to shooting, a case in which computer vision was applied was investigated [1]. Additionally, a python library called librosa is generally used for sound data analysis. Also, to learn the CNN model with sound data, the spectrogram technique must be applied [2].
- Reviewed abstract part of the paper. However, it should be modified

## Things to do by next week

- Add the introduction section contents that the proposed research can be applied, and get confirmed the modified abstract section and the draft of the introduction section
- Research some papers, and start to write literature review section
- Configure dataset about the gunshot sound and Implement the Sound Detection Model [2]
- Write a code that calculates the pixel difference between the two images and extracts the coordinates where the difference occurs using Raspberry Pi camera [1]
- Transmit and receive data (coordinates, images, etc.) via LoRa communication

## Problems or challenges:

- In order to obtain a target image outdoors, light or wind must be controlled [3]. So, this research proposes to place the camera in a protected box.
